Profile

I am a senior Software Engineer with a Bachelor's degree and an MSc in Computer Science, and **15+ years of professional experience** across the full software development lifecycle, with a strong focus on backend engineering. My background is centered on designing and building **cloud-based distributed systems**, from API definition to architecture design and implementation, with extensive experience in system optimization, scalability, and reliability.

My recent technical stack includes **Node.js (TypeScript and JavaScript)**, **AWS services**, and **Terraform**. More recently, I have been focusing on Rust and Kubernetes. I also have professional experience developing frontend applications using **Next.js**. In testing, I have strong hands-on experience with **Jest** and **Playwright**. I have extensive experience with **MongoDB** and **PostgreSQL**, working on high-throughput data systems involving replication and sharding.

In my most recent role, I led a team of five developers from the very early stages through the successful delivery of an MVP and its launch into production. My responsibilities included defining and communicating the **architecture**, guiding development, making technical decisions, and fostering strong team engagement. I have successfully **mentored** junior developers, enabling them to ramp up quickly and contribute effectively. I attribute my effectiveness as a team lead to **clear communication**—both within the engineering team and with stakeholders.

Experience

Team Lead - Founding Engineer, Ticketsoft (Contract)

Remote — June 2024 – February 2026

Led the design and development of the backend infrastructure for Ticketsoft, a Web3 platform enabling event organizers to issue and manage NFT-based tickets and event workflows on the blockchain.

Key responsibilities included architecting cloud infrastructure (AWS, Terraform), designing and implementing scalable APIs, and contributing to mobile app development (React Native + Expo). Designed and implemented smart contracts, advancing the blockchain solution from initial PoC through to MVP deployment. ***Technologies used***: TypeScript, Node.js, AWS, Terraform, React Native, Expo, Vitest, Stripe API, Solana, Polygon, Ethereum Base, EVM architectures, OpenZeppelin, IPFS.

Acted as team lead in a compact team of three developers, driving technical direction, code quality, and delivery timelines.

Senior Cloud Engineer, Wunderman Thompson/VML (Contract)

Remote — July 2023 – April 2025

I worked as a Cloud / Backend Engineer on a project focused on managing customer loyalty and identity for a large retail corporation. We designed and implemented an event-driven architecture using AWS and TypeScript to integrate multiple systems, including the loyalty platform, CRM, databases, and the broader customer backend ecosystem.

The solution was built using AWS services such as Lambda, Step Functions, SNS, and SQS, with Akamai for edge delivery. The observability tool was CloudWatch. My responsibilities covered the full lifecycle, from development to deployment, using the Serverless Framework. I also contributed to WPP Open and other internal projects built on a similar technical stack.

In addition, I collaborated with *Satalia* on the release of an internal LLM model builder to support one of their clients. This work was carried out using Python and GCP.

For a two-month period, I also volunteered to conduct technical interviews to help expand the team with Python developers. My role involved leading the technical interview sessions, which consisted of whiteboard exercises and Q&A, as well as providing structured feedback and aligning outcomes with hiring managers.

Senior Backend Engineer, Outplayed.com (Contract)

Remote — Aug 2022 – March 2023

I was a member of a 3-developer team supporting the infrastructure and code of the backend of outplayed.com. The backend is developed in TypeScript and AWS lambdas, SQS, SNS, and DynamoDB, all handled with Terraform. My daily tasks are debugging errors, implementing some new features, and monitoring the performance of the systems via Datadog and AWS console. I was responsible for implementing OAuth 2.0 to secure our API.

It is a data-intensive application that handles thousands of users and updates prices in milliseconds. Performance on the execution time and use of resources are key here, and their impact is immediately realizable in production.

Senior Backend Engineer, Big Town Chef / Coinburp (Contract)

Remote — Aug 2021 – Aug 2022

I designed, developed, tested, and deployed backend services to support blockchain smart contracts. The backend fetches all the on-chain events emitted by our contracts and processes them, stores them in a database, and exposes this data in an API to be consumed by our front end. The focus was on functional programming, small composable functions, and being easily testable.

The period I worked here covered the creation of the company token. creation of NFTs and the minting process. Staking of tokens and NFTs. Giving backend support to run raffles, lotteries, and gifts for staking to gather engagement from the community. Tech support for collaborations with other NFT projects and integration with them. ***Technologies used*:** TypeScript, Docker, Jest, Ava, Prisma, PostgreSQL, AWS

Senior Backend Engineer, Wabco (Contract)
Dublin, Ireland — Jan 2021 – July 2021

I worked as a backend developer in a serverless project to fetch, process, and store events from IoT devices. The software gathers information about all the devices installed in each fleet truck to control the vehicle. This project relied completely on AWS technologies: the application was split into lambda functions, S3, AWS IoT, AWS gateway... My role covered testing the current codebase, developing new functions, and refactoring code. ***Technologies used****:* Node, TypeScript, Jest, Serverless, AWS Gateway, SQS, DynamoDB, Lambda.

Senior Full-Stack Engineer, ConsenSys
Dublin, Ireland — Aug 2018 – Dec 2020

I worked as a full-stack developer in ConsenSys. My work balance between frontend and backend is 70% − 30% respectively. I am part of the development team of *Komgo* project (https://komgo.io/) a platform to trade commodities over a private blockchain based on Ethereum. My daily work includes design, the definition of user stories, and direct contact with the client in an agile environment. I have actively contributed to the design and implementation of the KYC application and the sharing and signing of documents between nodes using Solidity. My role also includes mentoring and helping new members to ramp up on the team.

Technologies used**:** Blockchain, Ethereum, Quorum, Solidity, Ganache, Typescript, React, Redux, Jest, Docker, AWS, Kubernetes, Kaleido.

Senior Backend Engineer, VSware
Dublin, Ireland — Sep 2017 – Jul 2018

I maintained the main module through bug fixing and new feature development. My daily work included refactoring, cleaning code, and improving the performance of the system.
Technologies used: VueJS, JavaScript, Java, Spring, SQL

Software Engineer, EdgeVerve / Infosys
Dublin, Ireland — Jul 2016 – Sep 2017

Our areas of investigation are distributed systems and blockchain. The goal of the lab is to design and develop proof-of-concept prototypes to explore new technologies to open new lines of business. ***Technologies used*****:** Scala, Akka, JavaScript, React, VueJS, NodeJS, Docker. I have actively participated in:

- *Smart bond*: a project built on Ethereum to manage the distribution of bonds from issuers to investors. The system was built to be network agnostic (Quorum, OpenLedger) and fully scalable.
- *Secure Akka*: a distributed system based on CRDT to handle the creation and distribution of certificates over a non-reliable network of nodes. All the information is shared in a safe and verifiable way. Users can grant permissions to other users to access those items and revoke them at any time.

Software Developer, BAE Systems Applied Intelligence
Dublin, Ireland — Feb 2015 – Jun 2016

Developer of *WLM* (WatchList Manager) component of *NetReveal* solution. *NetReveal* is a software package to combat fraud, intended for government departments, the finance sector, and commercial organizations.

- Bugfixing defects on the text-matching algorithms. Corrections on the match scoring methods and improvements of the performance.
- Full refactoring of some important pieces of code.
- Design and implementation of new features such as “Swift 2015 message” support.

Programmer Analyst, Nortia – Inteligencia de Negocio
Gijon, Spain — Jun 2013 - Nov 2014

I worked in the development team of *Segmentia*, an application for market segmentation in supermarkets. This tool enables marketing experts to create, manage, and execute market campaigns with complex criteria regardless of the database platform they use.
My daily work included bug fixing (backend and frontend) using Groovy language & Griffon.
I was responsible for implementing new features and testing the codebase. I automated key routines for the deployment process and provided help desk support to our clients (major supermarket chains in Spain and Portugal).

R&D in Semantic Technologies, CTIC Technological Center
Gijon, Spain — Feb 2012 - Feb 2013

Internship "Introduction to research" in the R+D+i area. The research field was NLP, semantic technologies, and text mining: information retrieval, word sense disambiguation, topic modeling, automatic classification of the corpus, and automatic topic extraction.

Embedded System Developer, Ingen10
Gijon, Spain — Aug 2010 - May 2011

Part of the team developing software for electronic systems in the R&D department. Worked with ATmega and PIC microprocessors using low-level languages such as C and Assembler. I have designed and implemented desktop software for receiving measurements from potentiostat devices and representing them on a plot using Java and the Swing graphical library.

Education

MSc in Computer Science. University of Oviedo (Spain)
GPA 3.8 out of 4 — 2008 - 2011

Thesis: “Study and design of a prototype for managing the evolution of the competencies in a company using fuzzy logic and other methods of artificial intelligence”. Graded with 9.5.
(Webpage of the project https://sourceforge.net/projects/empl-prof-view/)

BSc in Computer Science. University of Oviedo (Spain)
GPA 3.7 out of 4 — 2004 - 2008

Specialist: “Systems administration” and “Internet applications integration” Thesis: “Web application – Automata simulator in Struts 2”. Graded with 9.

Skills

- **Main languages:** TypeScript, JavaScript, Terraform, Rust.
- **Knowledge in:** Java, Scala, Solidity

- **Infra:** AWS services, Docker, OAuth 2.0 + OpenID, Kubernetes
- **AWS:** Lambda, Gateway, SQS, SNS, Cognito, ECS + EC2 + Fargate, Redis, Cloudwatch, Cloudfront.
- **Testing:** Jest, Vitest, Playwright, K6
- **Frontend:** React, NextJS
- **Databases:** DynamoDB, MongoDB, PostgreSQL, GraphQL

- **Blockchain:** Solana, Ethereum EVM
